This concept provides the opportunity to use a modular structure of the software, i.e. different multibody formalisms may be combined with different simulation programmes via standardized interfaces. For the DFG project the database RSYST was chosen using standard FORTRAN 77 and an object oriented multibody system datamodel was defined.

Multibody dynamics, as opposed to Multi Flexible Body Dynamics (MFBD), is the simulation of groups of bodies idealized as being perfectly rigid. Multi-body dynamics simulation software predicts the motion and the interaction forces by automatically formulating differential equations to describe the motion of a system of bodies and then solving them numerically.

This paper presents a novel recursive divide-and-conquer formulation for the simulation of complex constrained multibody system dynamics based on Hamilton's canonical equations (HDCA). The systems under consideration are subjected to holonomic, independent constraints and may include serial chains, tree chains, or closed-loop topologies.

A multibody dynamic (MBD) system is one that consists of solid bodies, or links, that are connected to each other by joints that restrict their relative motion. The study of MBD is the analysis of how mechanism systems move under the influence of forces, also known as forward dynamics. A study of the inverse problem, i.e. what forces are necessary to make the mechanical system move in a ...

In this paper, a modular formulation of multibody systems is proposed which is based on the block representation of a multibody system with corresponding input and output quantities. Advantages of this modular approach range from independent and parallel modeling of subsystems over the easy exchange of the resulting modules to the use of different software for each module.
