Synopsis. Group rings play a central role in the theory of representations of groups and are very interesting algebraic objects in their own right. In their study, many branches of algebra come to a rich interplay. This book takes the reader from beginning to research level and contains many topics that, so far, were only found in papers published in scientific journals and, whenever possible, offers new proofs of known results.

A group is called of finite order if it has finitely many elements. It is called abelian if it is commutative:  $gh = hg$  for all  $g, h \in G$ . 1.2. Subgroup and order. A subgroup  $H$  of a group  $G$  is a non-empty subset of  $G$  such that (i)  $e \in H$ , (ii) if  $g, h \in H$  then  $gh \in H$ , and (iii) if  $g \in H$  then also  $g^{-1} \in H$ . One readily checks that in fact  $H$  is a group.

then the hypercomplex numbers generated by  $G$  is called the Group Ring  $(RG)$ . Arthur Cayley 1854. Definition 1.11 Given a group  $G$  and a ring  $R$ , define the Group Ring  $RG$  to be the set of all linear combinations  $\sum_{g \in G} a_g g$  where  $a_g \in R$  and where only finitely many of the  $a_g$ s are non-zero. Define the sum  $(\sum_{g \in G} a_g g) + (\sum_{g \in G} b_g g) = \sum_{g \in G} (a_g + b_g)g$ .

WHAT IS A GROUP RING? D. S. PASSMAN 1. Introduction. Let  $K$  be a field. Suppose we are given some three element set  $\{a, b, c\}$  and we are asked to form a  $K$ -vector space  $V$  with this set as a basis. Then certainly we merely take  $V$  to be the collection of all formal sums  $\sum_{g \in G} a_g g$ ,  $(\sum_{g \in G} a_g g) + (\sum_{g \in G} b_g g) = \sum_{g \in G} (a_g + b_g)g$  with  $a, b, c \in K$ . In the same way if we were

What is a Group Ring?

In algebra, a group ring is a free module and at the same time a ring, constructed in a natural way from any given ring and any given group. As a free module, its ring of scalars is the given ring, and its basis is one-to-one with the given group.

'Rings, Fields and Groups' gives a stimulating and unusual introduction to the results, methods and ideas now commonly studied on abstract algebra courses at undergraduate level. The author provides a mixture of informal and formal material which help to stimulate the enthusiasm of the student, whilst still providing the essential theoretical concepts necessary for serious study.

Definition 1.1 A ring is a triple  $(R, +, \cdot)$  where  $R$  is a set, and  $+$  and  $\cdot$  are binary operations on  $R$  (called addition and multiplication respectively) so that: (1)  $(R, +)$  is an abelian group (with identity denoted by  $0$  and the inverse of  $x \in R$  denoted by  $-x$ , as usual.) (2) Multiplication is associative.

EXERCISES AND SOLUTIONS IN GROUPS RINGS AND FIELDS 5 that  $(y(a)a)y(a)t = e$  then  $(y(a)a)e = e$  Hence  $y(a)a = e$ : So every right inverse is also a left inverse. Now for any  $a \in G$  we have  $ea = (ay(a))a = a(y(a)a) = ae = a$  as  $e$  is a right identity. Hence  $e$  is a left identity. 2.4. If  $G$  is a group of even order, prove that it has an element  $a \neq e$  satisfying  $a^2 = e$ :

In ring theory an idempotent element, or simply an idempotent, of a ring is an element  $a$  such that  $a^2 = a$ . That is, the element is idempotent under the ring's multiplication. Inductively then, one can also conclude that  $a = a^2 = a^3 = a^4 = \dots = a^n$  for any positive integer  $n$ . For example, an idempotent element of a matrix ring is precisely an idempotent matrix. For general rings, elements idempotent under multiplication are involved in decompositions of modules, and connected to homological proper
