1 EXPERIMENT 17 : Lewis Dot Structure / VSEPR Theory Materials: Molecular Model Kit INTRODUCTION Although it has recently become possible to image molecules and even atoms using a high-resolution microscope, most of our information about molecular structure comes from often this information enables us to piece together a 3-dimensional picture of the molecule. On paper, one of the best methods we have of representing this model is by drawing a Lewis Dot Structure of the molecule or ion.

Lewis Structures. A Lewis Structure is a representation of covalent molecules (or polyatomic ions) where all the valence electrons are shown distributed about the bonded atoms as either shared electron pairs (bond pairs) or unshared electron pairs (lone pairs). A shared pair of electrons is represented as a short line (a single bond).

Lewis Structures, Introduction, Formal Charge, Molecular ...

Thus far, we have used two-dimensional Lewis structures to represent molecules. However, molecular structure is actually three-dimensional, and it is important to be able to describe molecular bonds in terms of their distances, angles, and relative arrangements in space (Δ). A bond angle is the angle between any two bonds that include a common atom, usually measured in degrees.
