Many traditional data structures rely on the structures being mutable. We can update search trees, change links in linked lists, and rearrange values in a vector.

1. R Vector. Vector is the most basic data structure in R programming language. It comes in two parts: Atomic vectors and Lists. They have three common properties: Type function – what actually it is? Length function – how many elements does it contain. Attribute function – extra arbitrary metadata. These elements have different types.

The following data structures are common in R: vector: Contains a sequence of items of the same type. This is most basic structure. Items of a vector can be accessed using []. Function length can be called to know the number of items. list: Represented as a vector but can contain items of different types.

Filtering in R is easy. For data frames, we can use use tidyverse::filter. For most other things, we can simply use R's vectorization. However, when all else fails, base R does indeed have a Filter() function. Example: Filter(function(x) x %% 2 == 0, 1:10) # [1] 2 4 6 8 10. Similarly, you probably won't ever need Reduce() in R.

A data frame in R programming is a 2-dimensional array-like structure that also resembles a table, in which each column contains values of one variable and each row contains one set of values from each column. A data frame has the following characteristics: The column names of a data frame should not be empty. Row names should be unique.

A vector is the basic data structure in R, or we can say vectors are the most basic R data objects. There are six types of atomic vectors such as logical, integer, character, double, and raw. "A vector is a collection of elements which is most commonly of mode character, integer, logical or numeric" A vector can be one of the following two types:

In computer science, a finger tree is a purely functional data structure that can be used to efficiently implement other functional data structures. A finger tree gives amortized constant time access to the "fingers" (leaves) of the tree, which is where data is stored, and concatenation and splitting logarithmic time in the size of the smaller piece. It also stores in each internal node the ...
