This is a comprehensive gathering of measurement and assessment techniques for aquatic toxicants. Covering everything from ASTM and similar standard methods to new and innovative techniques, Techniques in Aquatic Toxicology provides necessary details on sampling, testing, and analysis in both saltwater and freshwater environments. Research scientists and field and laboratory technicians will find help in testing for everything from assessing DNA damage to bioaccumulation of common toxins to assays of fish embryos and fish tissues.

For a long time microbial ecology has been developed as a distinct field within Ecology. In spite of the important role of microorganisms in the environment, this group of 'invisible' organisms remained unaccessible to other ecologists. Detection and identification of microorganisms remain largely dependent on isolation techniques and characterisation of pure cultures. We now realise that only a minor fraction of the microbial community can be cultivated. As a result of the introduction of molecular methods, microbes can now be detected and identified at the DNA/RNA level in their natural environment. This has opened a new field in ecology: Molecular Microbial Ecology. In the present manual we aim to introduce the microbial ecologist to a selected number of current molecular techniques that are relevant in microbial ecology. The first edition of the manual contains 33 chapters and an equal number of additional chapters will be added this year. Since the field of molecular ecology is in a continuous progress, we aim to update and extend the Manual regularly and will invite anyone to deposit their new protocols in full detail in the next edition of this Manual. We hope this book finds its place where it was born: at the lab bench! Antoon D.L.
