Many of the main uses for matrices in multivariable calculus involve calculating something called the determinant. It's useful, for example, to calculate the cross product as well as a change of variables. The determinant of a matrix is defined only for square matrices, i.e., $n \times n$ matrices with the same number of rows and columns.

Multivariable calculus is used in many fields of natural and social science and engineering to model and study high-dimensional systems that exhibit deterministic behavior. In economics , for example, consumer choice over a variety of goods, and producer choice over various inputs to use and outputs to produce, are modeled with multivariate ...

In mathematics, matrix calculus is a specialized notation for doing multivariable calculus, especially over spaces of matrices. It collects the various partial derivatives of a single function with respect to many variables, and/or of a multivariate function with respect to a single variable, into vectors and matrices that can be treated as single entities.

If I want to find the entries of a product of two matrices, A and B -- I'm saying matrices, but of course they could be vectors. Vectors are now a special case of matrices, just by taking a matrix of width one. So, if I have my matrix A, and I have my matrix B, then I will get the product, AB.
